

GitButler CLI Cheat Sheet

Essential commands for working with GitButler

GitButler is a Git client that allows you to work on multiple branches simultaneously. This cheat sheet features the most important and commonly used GitButler CLI commands for easy reference.

Setup and Teardown

Switching to and from GitButler branch management

```
but setup
```

Switch to GitButler in the current repository

```
but teardown
```

Go back to vanilla git branch management

Branch Management

Create and manage parallel and stacked branches

```
but branch
```

List all branches available

```
but branch new [name]
```

Create a new parallel branch

```
but branch new [name] --anchor [branch]
```

Create a new stacked branch from an existing branch

```
but reword [branch] -m "[new-name]"
```

Rename a branch

```
but apply [branch]
```

Apply (enable) a branch to your working directory

```
but unapply [branch|id]
```

Unapply (disable) a branch from your working directory

Inspection

View your workspace state and changes

```
but status
```

Show uncommitted changes, applied branches, and commits

```
but status -fv
```

Show committed files, IDs, authors, and timestamps

```
but status -u
```

Show detailed list of unintegrated upstream commits

```
but diff
```

Show uncommitted changes and their file and hunk IDs

```
but diff [id]
```

Show changes for one file, commit, branch, or stack

```
but show [id]
```

Show details for a commit or branch

GitButler CLI Cheat Sheet

```
but clean --dry-run
```

Preview empty branches that can be removed

```
but branch list [search]
```

List all branches whose names match the search term

```
but branch delete [branch]
```

Delete a branch from the workspace

Remote Operations

Push changes and interact with forges

```
but push [branch]
```

Push one branch to its remote

```
but pull
```

Update the target and rebase all applied branches

```
but pull --check
```

See what a pull would do without making changes

```
but pr new [branch] -t
```

Push a branch or stack and create its reviews

```
but config forge
```

View and modify forge authentications

```
but land [branch]
```

Land a branch directly on the target without a pull request

Committing Changes

Create commits on your branches

```
but commit -b [branch] -m "[message]"
```

Commit all uncommitted changes; create the branch if needed

```
but commit -b [branch] -m  
"[message]" [change-id]...
```

Commit selected files or hunks from but diff

```
but commit --interactive -b [branch] -m  
"[message]"
```

Select changes for a commit in the terminal UI

```
but commit --empty -b [branch] -m "[message]"
```

Create an empty commit

Commit Editing

Modify existing commits

```
but reword [commit] -m "[message]"
```

Change a commit message

```
but amend -t [commit] [change-id]...
```

Amend uncommitted files or hunks into a commit

```
but pick [commit] [branch]
```

Cherry-pick a commit into an applied branch

```
but squash [source] -t [target] -m  
"[message]"
```

Combine commits

```
but move [source] --above [target]
```

Move a commit or branch above another commit or branch

```
but uncommit [commit]
```

Move a commit back to uncommitted changes

GitButler CLI Cheat Sheet

Operations Log

View and restore workspace history

```
but undo
```

Undo the last operation

```
but redo
```

Redo the last undo

```
but oplog
```

Show operation history of workspace

```
but oplog restore [oplog-sha]
```

Restore workspace to a specific snapshot

```
but oplog snapshot -m "[message]"
```

Create an on-demand snapshot with message

Helper Commands

Open GitButler and configure terminal integrations

```
but gui
```

Open the GUI to the current project

```
but tui
```

Open the interactive terminal UI

```
but alias
```

Create and manage aliases for commonly used commands

```
but config
```

View and modify GitButler configuration settings

```
but update
```

Check for and install updates to GitButler

Conflict Management

Resolve conflicts in commits

```
but resolve [commit]
```

Enter resolution mode for a conflicted commit

```
but resolve finish
```

Finish the current conflict resolution

GitButler CLI Cheat Sheet

```
but skill check --update
```

Check and update installed GitButler agent skills

```
but agent
```

Configure GitButler for AI coding agents
